

# Full jet reconstruction in $p + p$ collisions at $\sqrt{s} = 200$ GeV in PHENIX

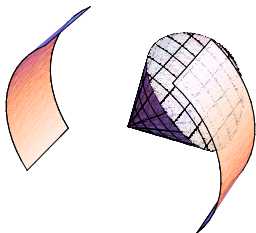

Yue Shi Lai

Columbia University and Nevis Laboratories/PHENIX Collaboration

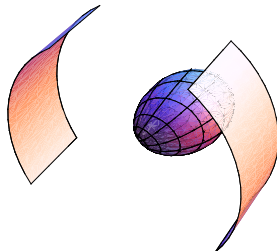

DNP08, Session MD

# Jet reconstruction as convolution

- Convolution is a generalization of the cone algorithm (without merge/split)

"Cone"  $R = 0.5$

Gaussian kernel  $\sigma = 0.5$

- Gaussian filter:

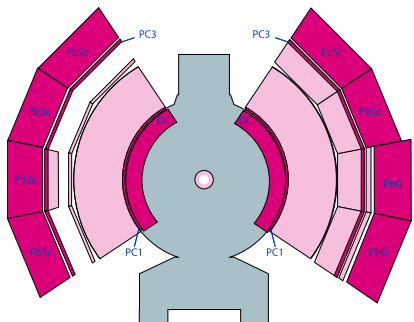

$$\tilde{p}_T(\eta, \varphi) = p_T \circledast h \equiv \iint_{\mathbb{R} \times S^1} d\eta' d\varphi' p_T(\eta', \varphi') h(\eta - \eta', \varphi - \varphi') = \max!$$

$$h(\eta, \varphi) = e^{-(\eta^2 + \varphi_{\text{ar}}^2)/(2\sigma^2)}$$

# Why Gaussian filter

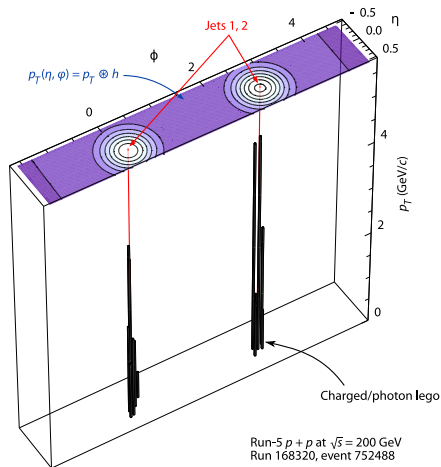

- Generalized cone algorithm – preserves the “cone”-like property
- Naturally collinear and infrared safe
- Smooth angular cut-offs for finite acceptance – e.g. PHENIX Central Arm
  - $-0.35 < \eta < 0.35$
  - $-0.59 < \varphi < 0.98, 2.16 < \varphi < 3.73$
- Generalizable to central Au + Au at  $\sqrt{s_{NN}} = 200$  GeV while having
  - fake jet rate sufficiently low to measure jet quenching
  - near unitary efficiency for the most RHIC-accessible jet energy range
- Fast, for central Au + Au at  $\sqrt{s_{NN}} = 200$  GeV multiplicity:
  - $\approx 1.9\times$  reconstructed event/s of Fast  $k_T$
  - $> 30\times$  reconstructed event/s of SISCone
- Partially inspired by the energy flow observable  $\bar{f}_{\bar{\Omega}_c}$  in C. F. Berger, T. Kucs, G. Sterman, Phys. Rev. D **68**, 014012 (2003); G. Sterman, hep-ph/0501270
- Study for  $p + p$  collisions: arXiv:0806.1499, paper regarding the heavy ion study is coming soon

# PHENIX Run-5

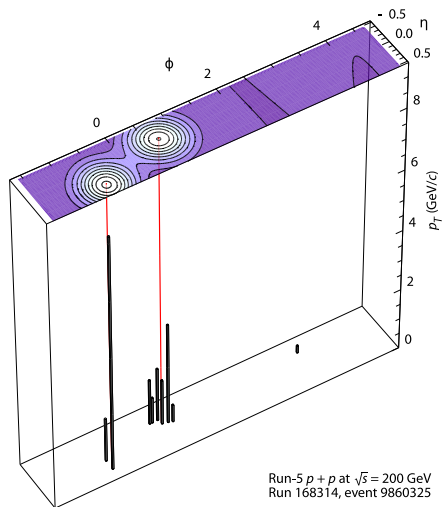

- Data set: PHENIX Run-5  $p + p$  at  $\sqrt{s} = 200$  GeV
  - Tracking detectors: Drift Chamber (DC), Pad Chambers (PC) 1/3
  - Calorimeters: Lead-Scintillator (PbSc), Lead-Glass (PbGl)
- Gaussian kernel with  $\sigma = 0.3$
- Jet reconstruction cuts for background suppression:
  - $\geq 3$  particles in a  $60^\circ$  cone
  - $\max z < 0.95$

# Event display (PHENIX data)

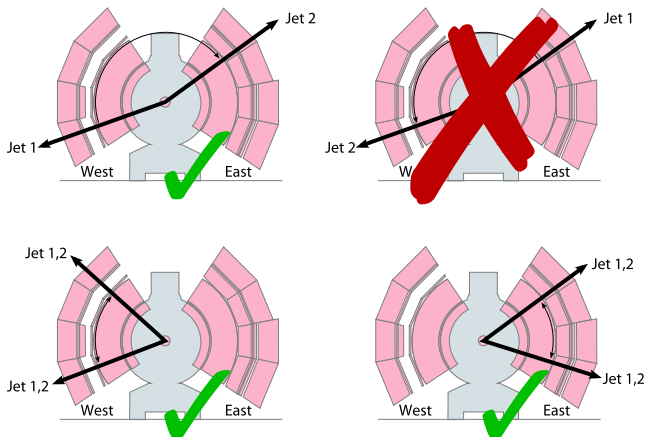

- Top: filter density contour
- Bottom: (charged and neutral)  $p_T$  Lego plot
- Red line: jet axes

# Event display (PHENIX data)

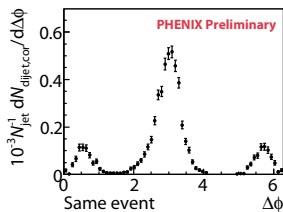

- Top: filter density contour
- Bottom: (charged and neutral)  $p_T$  Lego plot
- Red line: jet axes

# Unsymmetrized correlation

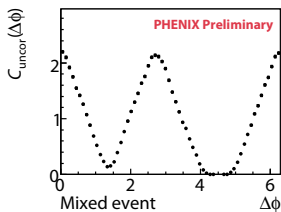

- Unsymmetrized, one-sided correlation to show the full PHENIX azimuthal acceptance effect

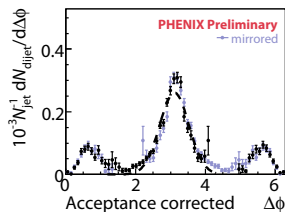

# Jet-jet correlation, symmetric $4 < p_{T,\text{jet,rec}} < 6 \text{ GeV}/c$

Run-5  $p + p$  at  $\sqrt{s} = 200 \text{ GeV}$

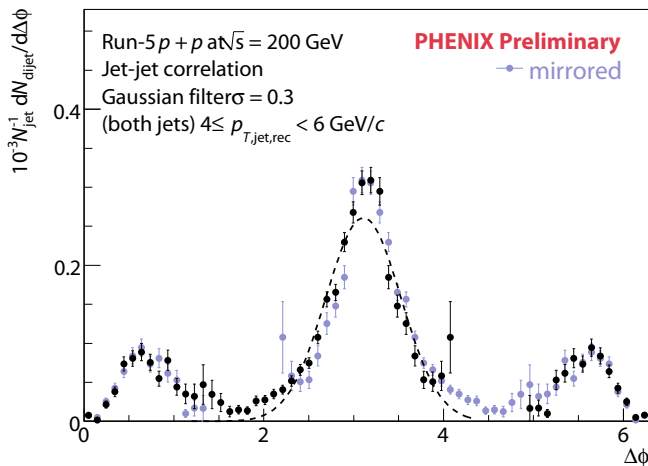

Jet-jet correlation,  $\sigma = 0.3$

(both jets)  $4 \leq p_{T,\text{jet,rec}} < 6 \text{ GeV}/c$

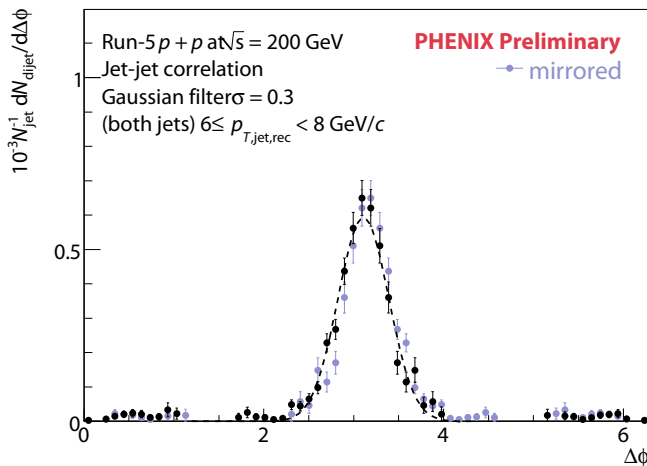

- We recover a uniform azimuth acceptance by dividing same-event by mixed-event jet-jet correlation
- Correlation function is symmetric even with unsymmetrized PHENIX acceptance

# Jet-jet correlation, symmetric $4 < p_{T,\text{jet,rec}} < 6 \text{ GeV}/c$

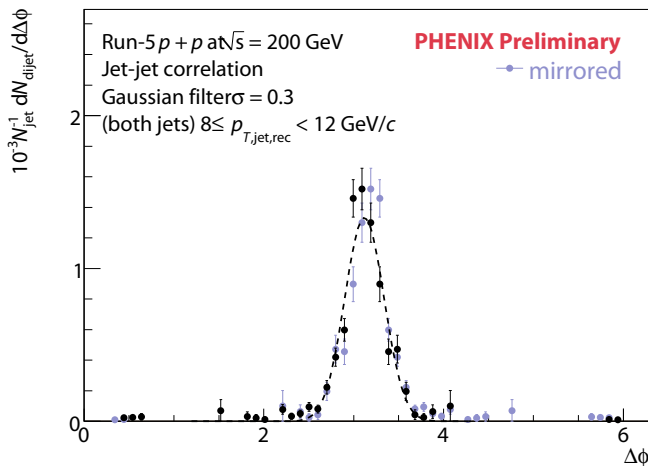

■ Gaussian fit: mean = 3.107 8(92),  $\sigma = 4.186(10)$

# Jet-jet correlation, symmetric $6 < p_{T,\text{jet,rec}} < 8 \text{ GeV}/c$

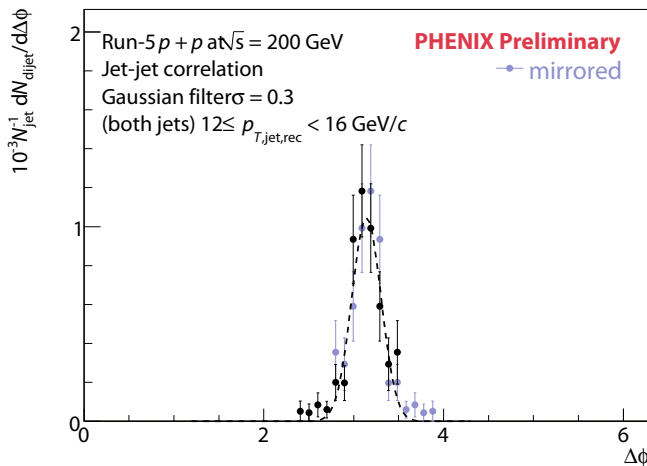

■ Gaussian fit: mean = 3.1076(98),  $\sigma = 2.8196(95)$

# Jet-jet correlation, symmetric $8 < p_{T,\text{jet,rec}} < 12 \text{ GeV}/c$

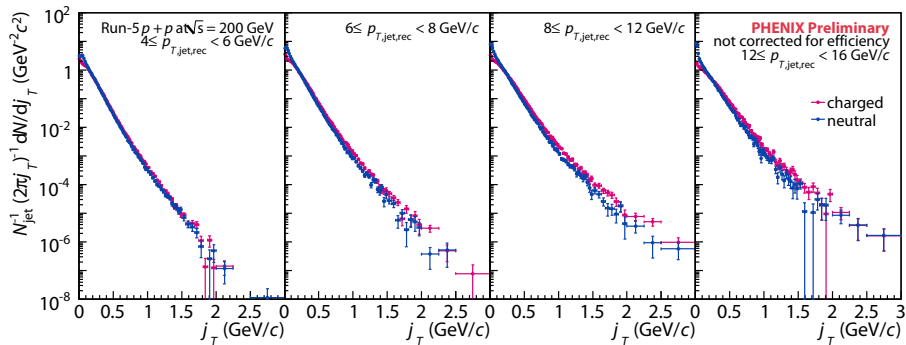

■ Gaussian fit: mean = 3.1189(92),  $\sigma = 2.1858(87)$

# Jet-jet correlation, symmetric $12 < p_{T,\text{jet,rec}} < 16 \text{ GeV}/c$

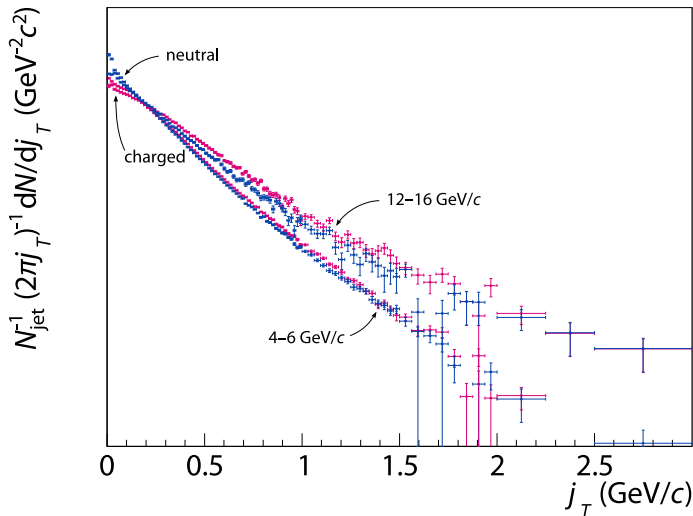

■ Gaussian fit: mean = 3.141(20),  $\sigma = 1.636(25)$

# Fragment $j_T$ distribution

- Non-perturbative component uniform across all  $p_T$  range
- Difference in slope due to Seagull effect

# Fragment $j_T$ distribution, 4–6 vs. 12–16 GeV/ $c$

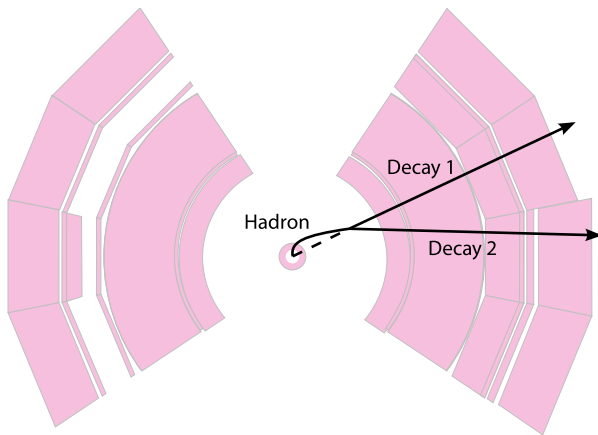

# Summary

- Gaussian filter as a jet reconstruction algorithm insensitive to large angle distortion – either acceptance limit or heavy ion fluctuation
  - First application on PHENIX
- PHENIX acceptance limit does not hinder jet reconstruction or  $2\pi$ -azimuthal jet variable
- Jet spectrum and fragmentation will be available soon, after completing the detector simulation
- Cu + Cu, Au + Au results are underway

# Part I

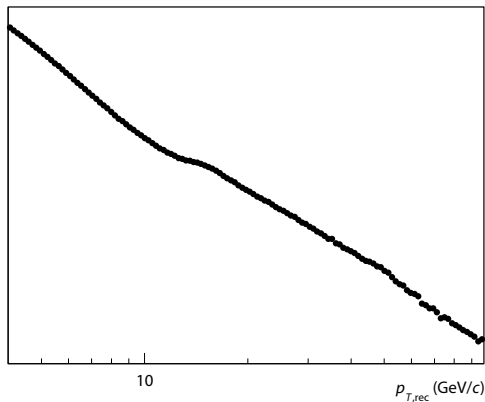

## Backup

# Conversion tracks

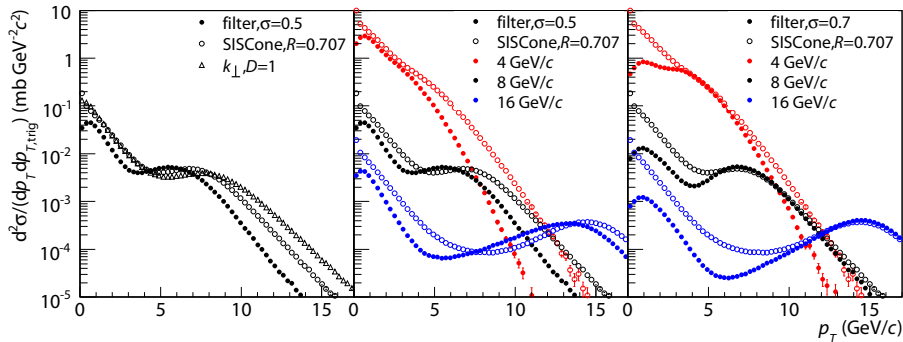

- Track  $p_T$  misreconstruction due to early decays

# Uncorrected $p_{T,jet}$ spectrum

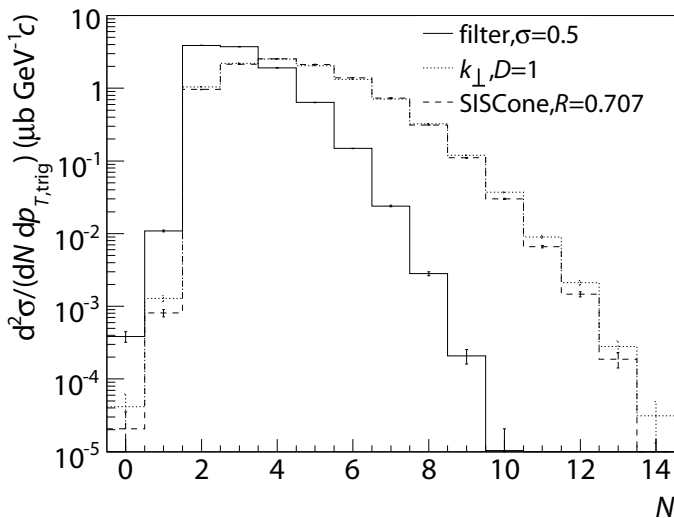

- Full detector trigger and  $p_T$  scale effect
- Residual non-linearity is expected to go away with proper trigger efficiency and  $p_T$  correction
